IDENTIFIERS	Current Population Survey; Time Series Analysis

ABSTRACT

This report contains data on the educational attainment of persons in the United States from the Current Population Surveys of the Census in March 1990 and 1991. Summary data on years of school completed by: (1) age; (2) sex; (3) race; (4) Hispanic origin; (5) marital status; (6) household relationship; (7) education of spouse; (8) labor force status; (9) occupation; (10) income; (11) earnings; and (12) region of residence; are shown for 1990 and 1991 in Table 1. Other detailed data in similar categories are shown for 1991 in Tables 2 through 16. Tables 17 and 18 contain time series data from 1940 through 1991 from decennial censuses and current population reports. Summary data are also presented for all states and large metropolitan areas, as well as detailed data for the 25 largest states and 15 largest metropolitan areas. Over three-fourths of adults aged 25 and older have completed high school, and over one-fifth have completed four or more years of college. Educational attainment levels for young adults resemble those of the late 1970s. Among persons aged 25 and over, there is no statistical difference in proportions of women and men who complete high school, but a larger proportion of men have completed college. Whites and persons of races other than white or black have the highest level of high school completion for those aged over 25, and persons of races other than white or black have the highest college completion level. Both high school and college completion levels are higher in metropolitan areas. Four text tables, 1 figure, and 18 detailed tables present the information. Appendices provide definitions, explanations and a discussion of the source and accuracy of estimates. There are seven appendix tables. (SLD)

Acknowledgments

This report was prepared in the Education and Social Stratification Branch of the Population Division, under the general direction of **Robert Kominski**, Chief. Overall direction was provided by **Arthur J. Norton**, Assistant Chief, Population Division.

Data collection was conducted by Bureau of the Census field representatives, under the overall direction of **Stanley D. Matchett**, Chief, Field Division. Survey operations and data processing were coordinated by **Ronald R. Tucker** and **Gregory D. Weyland**, and programming of tabulations was performed by **Anh Ly**, Demographic Surveys Division. **D. Darcel Carter** and **Brenda R. Jeffries** assisted with table and manuscript preparation, and statistical testing. **Amara Bachu** and **Arthur Cresce**, Population Division, reviewed the contents of the report. Statistical review and appendix B were provided by **Caroline A. Riker**, Statistical Methods Division.

The staff of the Administrative and Publication Services Division, **Walter C. Odom**, Chief, provided publication planning, editorial review, design, composition and printing planning and procurement. The publication was edited and coordinated by **Nelsa D. Brown.**

Educational Attainment in the United States: March 1991 and 1990

(NOTE: The estimates for 1990 and 1991 in this report are inflated to national population controls by age, race, sex, and Hispanic origin. The population controls are based on results of the 1980 census carried forward to 1990 and 1991. The estimates in this report, therefore, may differ from estimates that would have been obtained using 1990 census results brought forward to the survey date. Population controls incorporating 1990 census results will be used for survey estimation beginning in 1993.)

INTRODUCTION

This report contains data on the educational attainment of persons in the United States from the Current Population Surveys (CPS) conducted by the Bureau of the Census in March 1990 and 1991. Summary data on years of school completed by age, sex, race and Hispanic origin are shown for 1990 and 1991 in Table 1. Other detailed data are shown for 1991 in tables 2 through 16. These data allow for the continuation of the biennial series of detailed tables as presented in previous reports. Tables 17 and 18 contain time series of data collected from 1940 to 1991 in the decennial censuses and CPS (1947-1991). This report is designed to provide published detailed tabulations of the data along with a short discussion of basic trends and attainment levels across many segments of the population.

The detailed tables present data on years of school completed by persons 15 years old and over, by age, sex, race, Hispanic origin, marital status, household relationship, education of spouse, labor force status, occupation, income, earnings, and region of residence. Summary data are also presented for all states and large metropolitan areas, as well as detailed data for the 25 largest states and 15 largest metropolitan areas.

HIGHLIGHTS

(Figures shown in parentheses define 90 percent confidence intervals. For details of calculation, see "Appendix B, Source and Accuracy of the Estimates.")

- Over three-fourths (78.4 ±.3) of all adults age 25 and over have completed high school; over one-fifth (21.4 ±.3) have completed four or more years of college. Both levels represent all-time national highs.
- Educational attainment levels for young adults (ages 25 to 29) in 1991 are not different from those recorded in the late 1970's. High school: 85.4 (±.6) vs. 85.4 (±.6) in 1977. College: 23.2 (±.7) vs. 23.3 (±.8) in 1978.
- Among persons 25 and over, there is no statistical difference in the proportion of men and women who have completed high school (78.5 ± .4 vs. 78.3 ± .4 percent). However, larger proportions of men (24.3 ±.4) than women (18.8 ±.3) have completed 4 or more years of college.
- While Whites and persons of races other than White or Black have the highest level of high school completion for those age 25 and above, persons of races other than White or Black have the highest college completion level. High school: White 79.9 (±.3), Black 66.7 (±1.1), other races 78.7 (±1.7) College: White 22.2 (±.3), Black 11.5 (±.7), other races 33.5 (±1.9)
- Both high school (80.4 ±.3) and college completion (23.7 ±.3) levels are higher in metropolitan than nonmetropolitan areas.

TRENDS IN EDUCATIONAL ATTAINMENT

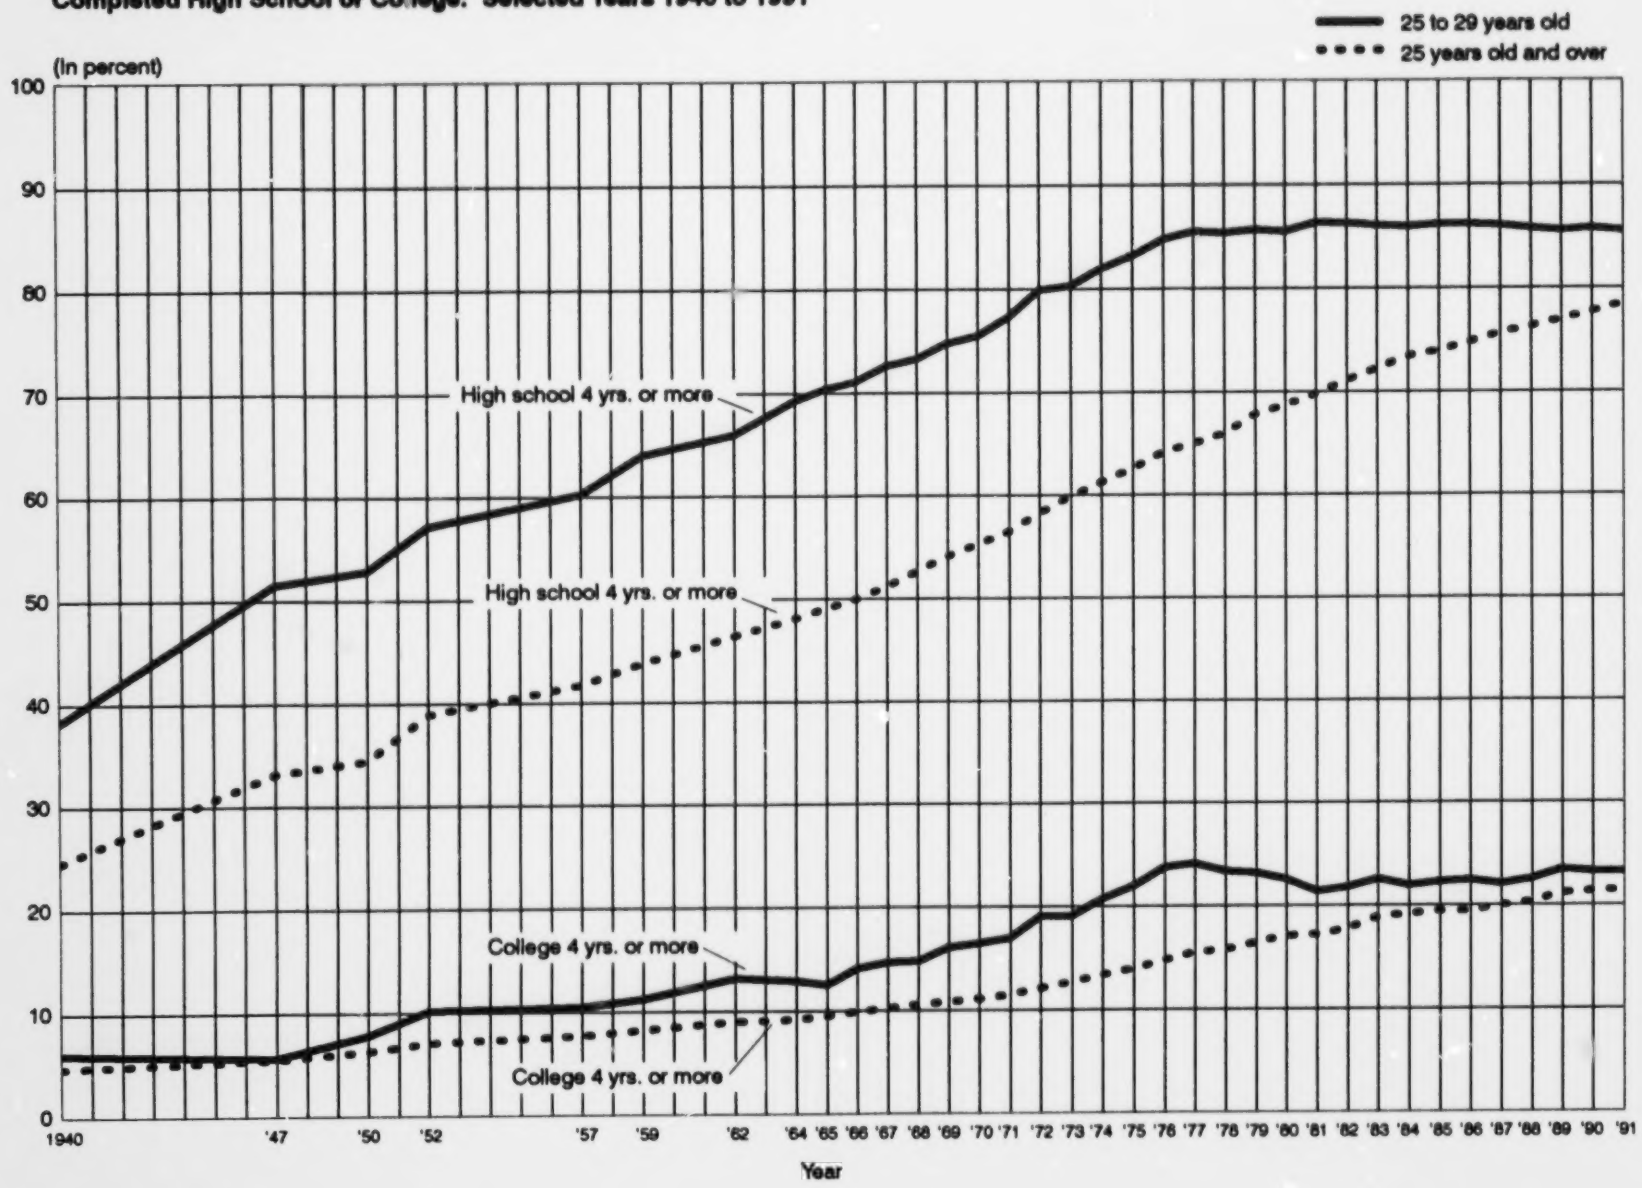
The educational level of the adult population continued to rise in 1991, following a general trend that has been noted in the Current Population Survey data since first produced in 1947. Over three-quarters (78.4 percent) of all adults age 25 or older reported completing at least 4 years of high school, the highest level measured in the history of the survey. The level of high school completion in 1991 reached a peak not only for the entire population, but also for each sex, and White persons. For Blacks the last statistical change was in 1990, while for Hispanics a detectable statistical difference last occurred in 1987.

Another basic measure of educational attainment is the proportion of persons who have completed four or more years of college. As with high school completion, this figure is also at a record-high level (although it is not statistically different from that recorded in 1989 or 1990). Over one-in-five adults (21.4 percent) age 25 or above have completed four or more years of college.

Figure 1 (based on Table 18) shows the proportion of persons having completed high school and four or more years of college for both the age 25 and over population and for persons ages 25 to 29. The latter group is often used to get a better idea of recent attainment levels. In general, the long-term rise in educational attainment for the general adult population is driven principally by the replacement of older less-educated persons by younger persons who have completed substantially more education.

This graph documents the general trend of rising educational attainment levels for the population, but also indicates that the increase in attainment among younger persons has slowed considerably, and may be

Figure 1.
Percent of Persons 25 Years Old and Over Who Have Completed High School or College: Selected Years 1940 to 1991



levelling off. For example, the proportion of 25 to 29 year olds who had completed high school for 1991 was no different than that recorded for 1977 (85.4 percent). While there has been some variation over this period, yearly point estimates have been in the range of 85-86 percent. Similarly, the estimated proportion of young persons completing 4 or more years of college has been in the low 20's since the mid-1970's. Given the very large differences in education between young and old age groups (table A), however, the attainment level of the total adult population will continue to rise for some time, as younger age groups replace older age groups, even if attainment levels for young persons remain constant.

EDUCATIONAL ATTAINMENT IN 1991

Traditionally, differences in educational attainment have been noted across many different dimensions; in 1991 this continued to be true. Tables A and B show three basic measures of educational attainment: completion of high school or more; completion of 1 or more years of college; and completion of 4 or more years of college. These measures are presented for the population ages 25 and older, cross-classified by a series of sociodemographic factors, in order to illustrate some of these differences. Data shown in these tables summarize the more detailed tabulations in this report

Gender: Educational attainment levels are higher for men than for women for two of the three measures shown in table A. In terms of high school completion,

Table A. **Summary Measures of the Educational Attainment of the Population, Ages 25 and Over: March 1991**

(Numbers in thousands)

Age, sex, race, region, residence, and Hispanic origin	Number of persons	Percentage with—		
		4 years of high school or more	1 or more years of college	4 or more years of college

Region:				
Northeast	33,293	80.3	39.7	23.7
Midwest	38,230	80.7	38.0	20.0
South	54,217	74.2	36.9	19.4
West	32,954	80.9	46.9	24.3
Metropolitan residence:				
Metropolitan area	123,097	80.4	42.9	23.7
Nonmetropolitan area	35,597	71.8	29.3	13.8
Farm	3,164	77.1	32.8	15.9

[1]May be of any race.

there is no statistical difference between men and women (78.5 vs. 78.3 percent). Differences are present at the college level, where 24.3 percent of men but only 18.8 percent of women have completed four or more years of college. About 37.4 percent of women and 42.5 percent of men have completed one or more years of college.

Race: Comparison of educational attainment among Whites, Blacks and persons of other races shows sizable differences. Among Whites, 79.9 percent have completed high school, not statistically different from the 78.7 percent recorded for persons of other races (which includes Asians and Pacific Islanders, and American Indians, Eskimos and Aleuts). The proportion for each of these groups is higher than the Black proportion of 66.7 percent.

Differences are also evident at the college completion level, with the highest levels reported by persons of other races: 33.5 percent have completed four or more years of college, compared to 22.2 percent of Whites, and 11.5 percent of Blacks. A similar ordering exists among these groups in the completion of one or more years of college.

Hispanic origin: At all three levels of attainment shown, persons of Hispanic origin (who may be of any race) have the lowest proportions of completed education, in comparison to Whites, Blacks, and persons of other races. About one-half of Hispanic adults have completed high school, 22 percent have completed 1 or more years of college, and about one in ten have completed four or more years of college.

Age: One dimension which shows great variability in measures of educational attainment is age. While half (49.0 percent) of those age 75 and above have completed high school, 87.7 percent of persons ages 35 to 44 have attained this level. In terms of postsecondary schooling, 10.5 percent of the age 75 and older population, as opposed to 27.5 percent of persons ages 35 to 44, have completed college. In general, for each education measure, attainment levels are lowest for the oldest age group, and rise across successively younger groups. Only the youngest age group shown in table A (ages 25 to 34) deviates from this pattern, primarily because some of these individuals have not completed their schooling, particularly at the postsecondary level.

Marital Status: Differences in educational attainment across marital statuses reflect to a large extent differences in the age composition of marital status groups. For example, the high level of high school completion among never married persons (81.6 percent) reflects the fact that this group is relatively young. Conversely, the low level among widowed persons (53.6 percent) is in part because this group consists primarily of older persons. A similar pattern is seen in college completion.

Region: Among the four Census regions (Northeast, Midwest, South and West) the proportion of persons who completed high school ranges from 74.2 in the South to 80.9 in the West. The South is significantly lower than the other three regions, which are statistically indistinct from each other. In terms of college attainment the West is highest in the completion of 1 or more years (46.9 percent), but is not statistically different from the Northeast in the completion of four or more years (24.3 vs. 23.7 percent). The data also show that attainment levels are higher for each of the three measures in metropolitan areas than in nonmetropolitan areas.

Labor force: The first panel of table B presents educational attainment measures for the civilian labor force, ages 25 and older. Among employed persons, educational attainment is quite high, with 87.3 percent of those employed reporting high school completion, and 27.3 percent having completed four or more years of college. For all three summary measures, attainment is higher for the employed than for the unemployed population, who in turn generally have higher attainment than those persons who are not in the labor force (with the exception of four or more years of college, where the level for those not employed is not statistically different from those not in the labor force).

Occupation: Table B also shows the educational attainment of employed persons ages 25 to 64, by major occupational groups. There is great variation in educational attainment when examined even across this small set of summary occupational categories. While 99.1 percent of the workers in professional specialty occupations have completed high school, 56.5 percent of private household workers have achieved this level of education.

With respect to higher education, 76.3 percent of persons in professional specialty occupations have completed four or more years of college, the highest level across the major occupation groups. For many occupations, however, fewer than ten percent of the workers have completed college; this includes categories such as precision production workers and machine operators.

Income: Table C shows estimates of mean personal income in 1990 for all persons reporting income for that year, detailed by several general levels of educational attainment, sex, race and Hispanic origin. As can be seen, the relationship of education and income is strongly positive; income levels are higher at each progressively higher level of education. This relationship holds true not only for the total population, but for each of the subgroups examined as well.

Variation in income by gender, race and Hispanic origin within each specific education level is also apparent, and may result from a variety of factors, including such things as occupational composition, age structure, labor force experience, and other forces. The relationship between education and income is a well-studied phenomenon; the data shown in table C are intended

Table B. **Educational Attainment by Labor Force Status and Occupation: March 1991**

(Numbers in thousands)

Occupations	Number of persons	Percentage with—

[1]May be of any race.

only to summarize the current level of that relationship, and do not address the more detailed issue of variations in income due to other social and demographic forces.

State and Metropolitan Area Estimates

In the last issue of this report, new tabulations showing educational attainment for all states and metropolitan areas were introduced.[1] Data for these areas are shown in tables 13 through 16 of this report. In using the data in these tables, readers are reminded that all estimates in the report are based on the CPS sample, and as such, have sampling variability associated with them. For this reason, the quantity needed to construct the 90-percent confidence interval is included with each estimate provided in Tables 13 through 16, and readers are strongly encouraged to use these values. While each CPS file is weighted to national population controls of age, race, sex, Hispanic origin and total state population, the nature of the CPS sample within any given state (or metropolitan area) can mean that year-to-year estimates may fluctuate due simply to the changes in sample in that area over time, as well as the fact that the population weighting is not controlled in the higher order cross-classifications of the control factors. In short, readers are cautioned that year-to-year comparisons of educational attainment within areas may show moderately large fluctuations in point estimates. However, the relative position of areas (that is, high, moderate or low attainment levels) should be fairly stable.

Table 13, for example, shows the two states with the highest point estimates for high school completion to be Utah and Washington, just as in the 1989 report. While

[1]Education Attainment in the United States: March 1989 and1988; Current Population Reports, Series P-20 No. 451.

these two states have the highest point estimates, however, their values are not statistically different from either each other or from a group of about 7 other states below them in a ranked list.[2] Many of these states were in a similar (high) position in the 1989 data. Likewise, many of the states at the lower end of the list are states in the South, just as in 1989. Thus, while one cannot make precise statements about exact rank, or changes in rank over time, the data do provide a general indication of the relative level of educational attainment across areas.

DETAILED TABULATIONS REDESIGN

A new set of detailed tabulations was introduced with the March 1989/1988 issue of this report. These new tabulations were the first major change in the tables since the 1976-1977 report, and provide greater detail and scope while maintaining consistency with the prior tabulation series. Table D provides a guide for users who wish to compile time-series data from both sets of tabulations.

DATA FILES AVAILABLE

The time series tabulations of attainment shown in tables 17 and 18 of this report are now also available on one low density floppy diskette. The tables are available as either two ASCII print files, or two LOTUS 1-2-3 © files (version 2.1). Users wishing to purchase files should specify which data format they prefer (ASCII or LOTUS), include a check for $10 (make checks payable to "Commerce-Census") and send to:

West Virginia	1 187	68.5	2.5	11.9	1.8
Wisconsin	3 160	80.1	2.1	20.5	2.1
Wyoming	287	85.3	2.3	21.0	2.7

Note: Population values shown in this table are derived from the CPS sample, and may not match independently-derived estimates of the population. See "State and Metropolitan Area Populations," in appendix A for more information.

[1]The value of 1.6 times the standard error [1.6*(s.e.)], added to and subtracted from the estimated percentage, yields the 90-percent confidence interval. For further details of calculation and interpretation, see appendix B, Source and Accuracy of the Estimates.

Table 14. Years of School Completed by Persons 18 Years Old and Over, by Age, Sex, Race, and Hispanic Origin, for the 25 Largest States: March 1991—Con.

[Numbers in thousands. Noninstitutional population]

Age, sex, race, Hispanic origin, and State	Total population	Completed 4 years of high school or more		Completed 4 years of college or more	
		Percent	1.6* (s.e.)[1]	Percent	1.6* (s.e.)[1]
Wisconsin					
18 years and over	3 580	80.9	1.9	18.9	1.9
18 to 24 years	421	87.3	4.7	6.7	3.5
25 to 44 years	1 524	91.4	2.1	24.1	3.2
45 to 64 years	912	83.4	3.6	23.0	4.0
65 years and over	724	52.1	5.4	9.6	3.2
25 years and over	3 160	80.1	2.1	20.5	2.1
Male	1 518	79.8	3.0	23.0	3.1
Female	1 642	80.3	2.9	18.2	2.8
White	2 996	81.1	2.1	20.9	2.2
Black	101	61.7	16.3	4.1	6.7
Hispanic origin[2]	14	(B)	(B)	(B)	(B)

Note: Based on population estimates of States as of July 1, 1986. Population values shown in this table are derived from the CPS sample, and may not match independently-derived estimates of the population. See "State and Metropolitan Area Populations," in appendix A for more information.

[1]The value of 1.6 times the standard error [1.6*(s.e.)], added to and subtracted from the estimated percentage, yields the 90-percent confidence interval. For further details of calculation and interpretation, see appendix B, Source and Accuracy of the Estimates.

[2]Persons of Hispanic origin may be of any race.

Note: Based on population estimates of metropolitan areas as of July 1, 1986. Population values shown in this table are derived from the CPS sample, and may not match independently derived estimates of the population. See "State and Metropolitan Area Populations," in appendix A for more information.

[1]The value of 1.6 times the standard error [1.6*(s.e.)], added to and subtracted from the estimated percentage, yields the 90-percent confidence interval. For further details of calculation and interpretation, see appendix B, Source and Accuracy of the Estimates.

[2]Persons of Hispanic origin may be of any race.

Revised. Beginning with data for 1988, a new edit and tabulation package has been introduced.

[1]Total includes persons who did not report on years of school completed.

Source: 1970, 1975, and 1980 to 1991 March Current Population Survey, (noninstitutional population, excluding members of the Armed Forces living in Barracks); 1960 Census of Population, 1950 Census Population, and 1940 Census of Population (resident population).

Table 18. Percent of Persons 25 Years Old and Over Who Have Completed High School or College, by Race, Hispanic Origin and Sex: Selected Years 1940 to 1991

(Noninstitutional population. For meaning of symbols, see text)

[1]Data are for Black and other races for 1940 to 1962; for 1963 to 1991, data are for Black persons only.
[2]Persons of Hispanic origin may be of any race.
Revised. Beginning with 1988, a new edit and tabulation package has been introduced.

Source: 1947, and 1952 to 1991 March Current Population Survey, (noninstitutional population, excluding members of the Armed Forces living in barracks) 1950 Census of Population and 1940 Census of Population (resident population).

Appendix A. Definitions and Explanations

Population coverage. The figures in this report for March 1990 and March 1991 are sample survey data and relate to the noninstitutional population of the 50 States and the District of Columbia. Members of the Armed Forces living off post or with their families on post are included; all other members of the Armed Forces are excluded.

Population figures shown for States and SMSA's are based on weighted results of the Current Population Survey and have not been adjusted to independent Census Bureau estimates.

The estimation procedure used for this survey involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates are based on civilian noninstitutional population counts from the decennial censuses and are updated with statistics on births, deaths, immigration, and emigration and statistics on the strength of the Armed Forces. Data published in this series for 1972 through 1979 were based on independent population estimates derived by updating the 1970 decennial census counts. Starting with the data collected in March 1980 Current Population Survey (CPS), independent estimates were based on civilian noninstitutional population controls for age, race, and sex established by the 1980 decennial census.

The April 1980 census population count differed somewhat from the independent estimates for April 1980 derived by updating 1970 census population figures. The April 1980 census count of the civilian noninstitutional population was 222,420,441, compared with the 1970 census based figure of 217,400,244 used for the CPS. Basically, this difference had little impact on summary or proportional measures, such as medians and percent distributions; however, use of the new controls could have significant effect on the absolute numbers.

Undocumented immigrants. The 1980 census counted about 2 million undocumented immigrants according to Census Bureau estimates. Beginning in January 1986, the independent population controls included an allowance for growth in the undocumented population for every year since 1980. This methodological change was partially offset by another change that increased the allowance for emigration of legal residents. Data shown for Current Population Surveys with controls based on pre-1986 methods have not been revised to take into account these methodological changes. Consequently, direct comparisons of CPS figures for months before January 1986 with later months will not be consistent. Series P-25, No. 985, reviews the postcensal population estimates methodology currently in use.

Age. The age classification is based on the age of the person at his/her last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black. In this report, "other races" is not shown separately.

Spanish origin. Information on origin or descent was obtained by asking, "What is (this person's) origin or descent?" Responses generally refer to a person's perceived national or ethnic lineage and do not necessarily indicate the country of birth of himself/herself or his/her parents.

Persons of Spanish origin are persons who reported themselves as Mexican American, Chicano, Mexican, Mexicano, Puerto Rican, Cuban, Central or South American, or other Spanish origin. However, all persons who reported themselves as Mexican American, Chicano, Mexican, or Mexicano were combined into the one category: Mexican. Persons of Spanish origin may be of any race.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to two questions: (a) "What is the highest grade of school he has ever attended?" and (b) "Did he finish this grade?"

The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the population into two equal parts one-half having completed more schooling and one-half having completed less schooling than the median. This median was computed after the statistics on years of school completed had been recovered to a continuous series of numbers (e.g., completion of the first year of high school was treated as completion of the 9th year and the completion of the first year of college as completion of the 13th year). The persons completing a given school year were assumed to be distributed evenly within the interval from .0 to .9 of the year (for example, persons completing the 12th year were assumed to be distributed evenly between 12.0 and 12.9). In fact, at the time of the March survey, most of the enrolled persons had completed about three-fourths of a school year beyond the highest grade completed, whereas a large majority of persons who were not enrolled had not attended any part of a grade beyond the highest one completed. The effect of the assumption is to place the median for younger persons slightly below, and for older person's slightly above, the true median. Because of the inexact assumption as to the distribution within an interval, this median is more appropriately used for comparing groups and the same group at different dates than as an absolute measure of educational attainment.

Marital status. The marital status classification identifies four major categories: single (never married), married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married spouse present," "separated," and "other married, spouse absent." Only the first is shown separately in this report. A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations and other persons permanently or temporarily separated because of marital discord. The remainder includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit, as partners, is also counted as a household. The count of households excludes group quarters.

Householder. The householder refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded.

Prior to 1980, the husband was always considered the householder in married-couple households. The number of householders is equal to the number of households. Also, the number of family householders is equal to the number of families.

Head versus householder. Beginning with the 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used. Recent social changes resulted in greater sharing of household responsibilities among the adult members and, therefore, have made the term "head" increasingly inappropriate in the analysis of household and family data. Specifically, the Census Bureau has discontinued its longtime practice of always classifying the husband as the reference person (head-) when he and his wife are living together.

In this report, the term "householder" is used in the presentation of data that had previously been presented with the designation "head."

Family. A family is a group of two persons or more (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered as members of one family.

Family household. A family household is a household maintained by a family (as defined above). The family householder is a designated householder of such a household. Prior to 1980 this person was referred to as the "family head."

Labor force status.

In the labor force. The definition of labor force and employment status relates to the population 15 years old and over. Persons are classified as in the labor force

if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. Data tabulated from the October CPS are for the civilian population only.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force."

Employed. Employed persons comprise (1) all civilians who, during the survey week containing March 12, did any work at all as paid employees or in their own business or profession, on their own farm, or in a business operated by a member of the family and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off, or (3) were waiting to report to a new wage or salary job within 30 days.

Full-time and part-time employment. Persons who worked 35 hours or more during the survey week and those who worked 1 to 34 hours but usually work full time are classified as employed full time. Part-time workers are persons who worked 1 to 34 hours during the survey week and usually work only 1 to 34 hours. Persons with a job but not at work during the survey week are classified according to whether they usually work full time or part time.

Year-round, full-time worker. A year-round, full-time worker is one who worked primarily at full-time jobs for 50 weeks or more during the preceding calendar year.

Occupation. Data on occupation are shown for the employed and relate to the job held during the survey week. Persons employed at two jobs or more were reported in the job at which they worked the greatest number of hours during the week. The major groups used here are generally the major groups used in the 1980 Census of Population, Vol. 1, Characteristics of the Population, U.S. Summary.

State and Metropolitan Area Populations. As part of the weighting procedure for the CPS, independent estimates of the civilian non-institutional population ages 16 and older for each state are used as one control factor. This control is used in an overall weighting procedure which also includes controls for age, race, sex and Hispanic/non-Hispanic categories. Use of the CPS sample to compute population estimates for specific states and metropolitan areas may be less precise than estimates which are independently derived, and which are not influenced by the weighting control factors, the interaction of these factors, and factors related to the specific design and sample selected. Current official (independently derived) estimates of the population are available in the Current Population Reports P-25 Series, or from the Population Estimates Branch, U.S. Bureau of the Census.

Metropolitan-nonmetropolitan residence. The population residing in metropolitan statistical areas (MSA's) constitutes the metropolitan population. MSA's are defined by the Office of Management and Budget for use in the presentation of statistics by agencies of the Federal Government. An MSA is a geographic area consisting of a large population nucleus, together with adjacent communities which have a high degree of economic and social integration with the nucleus. The definitions specify a boundary around each large city so as to include most of all its suburbs. Entire counties form the MSA building blocks, except in New England where cities and towns are used. The former term SMSA was changed to MSA in 1983.

An area qualifies for recognition as an MSA if (1) it includes a city of at least 50,000 population, or (2) it includes a Census Bureau-defined urbanized area of at least 50,000 with a total metropolitan population of at least 100,000 (75,000 in New England). In addition to the county containing the main city or urbanized area, an MSA may include other counties having strong commuting ties to the central county. If specific conditions are met, certain large MSA's are designated as consolidated MSA's (CMSA's) and divided into component primary MSA's (PMSA's).

Central cities. The largest city in each MSA is always designated a central city. There may be additional central cities if specified requirements, designed to identify places of central character within the MSA, are met. Although the largest central cities are generally included in the title of the MSA, there may be central cities that are not part of the title. The balance of the MSA outside the central city or cities often is regarded as equivalent to "suburbs."

Note to users. In July 1985, the CPS began carrying the metropolitan statistical area definitions announced by the Office of Management and Budget on June 30, 1984. Figures published from the CPS in the early 1980's and throughout most of the 1970's referred to metropolitan areas as defined on the basis of the 1970 census. Since there are important differences in the population classified as metropolitan using the 1970 and 1984 definitions, comparisons should be avoided.

The new CPS metropolitan estimates have consistently been higher than independent estimates of the metropolitan population prepared by the Census Bureau; the new CPS nonmetropolitan estimates have been lower than the independent estimates. For example, between July 1985 and August 1986, the magnitude of the monthly differences varied from 900,000 to 2.5 million persons, so that the proportion of the population living in metropolitan areas according to the CPS has ranged from 0.4 to 1.0 percentage points higher than the independent estimate. The difference in level between the two sets of estimates is partially attributable to the basic CPS sample design, which, because of sampling variability, includes an oversample of metropolitan households and an undersample of nonmetropolitan households. The monthly variations result from the exit and entrance of rotation groups, each with slightly different metropolitan-nonmetropolitan proportions, into the sample. The apparent overestimation of metropolitan and underestimation of nonmetropolitan population in the CPS relative to the Bureau's independent estimates should be taken into account when using the data.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The definition of a farm was changed in the mid-1970's, and the new definition was introduced into this data series beginning with the report for March 1980 and 1981.

According to the current definition, the farm population consists of all persons living in rural territory on places from which $1,000 or more of agricultural products were sold during the preceding 12 months. Rural persons in institutions, motels, and tourist camps are not classified as farm population. Farm population is independent of metropolitan-nonmetropolitan residence.

The nonfarm population comprises persons living in urban areas and all rural persons not on farms.

Geographic regions. The four major regions of the United States, for which data are presented in this report, represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

Midwest: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Symbols. A dash (-) represents zero or rounds to zero, and the symbol "B" means that the base for the derived figure is less than 75,000. An "X" means not applicable, and "NA" means not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals which are independently rounded. With few exceptions, percentages are based on the rounded absolute numbers.

Appendix B. Source and Accuracy of the Estimates

SOURCE OF DATA

Most estimates in this report come from data obtained in March 1990 and 1991 from the Current Population Survey (CPS). Some estimates are based on data obtained from the CPS in earlier years and from decennial censuses. The Bureau of the Census conducts the survey every month, although this report uses only March data for its estimates. The March survey uses two sets of questions, the basic CPS and the supplement.

Basic CPS. The basic CPS collects primarily labor force data about the civilian noninstitutional population. Interviewers ask questions concerning labor force participation about each member 15 years old and over in every sample household.

The March 1991 CPS sample was selected from the 1980 Decennial Census files with coverage in all 50 states and the District of Columbia. The sample is continually updated to account for new residential construction. It is located in 729 areas comprising 1,973 counties, independent cities, and minor civil divisions. About 60,000 occupied households are eligible for interview every month. Interviewers are unable to obtain interviews at about 2,600 of these units because the occupants are not home after repeated calls or are unavailable for some other reason.

Since the introduction of the CPS, the Bureau of the Census has redesigned the CPS sample several times to improve the quality and reliability of the data and to satisfy changing data needs. The most recent changes were completely implemented in July 1985.

The following table summarizes changes in the CPS designs for the years for which data appear in this report.

March Supplement. In addition to the basic CPS questions, interviewers asked supplementary questions in March about educational attainment.

To obtain more reliable data for the Hispanic origin population, the March CPS sample was increased by about 2,500 eligible housing units, interviewed the previous November, that contained at least one sample person of Hispanic origin. In addition, the sample included persons in the Armed Forces living off post or with their families on post.

Description of the March Current Population Survey

Time period	Number of sample areas	Housing units eligible[1]	
		Interviewed	Not interviewed
1990 to 1991	729	57,400	2,600
1989	729	53,600	2,500
1986 to 1988	729	57,000	2,500
1985	[2]629/729	57,000	2,500
1982 to 1984	629	59,000	2,500
1980 to 1981	629	65,500	3,000
1977 to 1979	614	55,000	3,000
1973 to 1976	461	46,500	2,500
1972	449	45,000	2,000
1967 to 1971	449	48,000	2,000
1963 to 1966	357	33,500	1,500
1960 to 1962	333	33,500	1,500
1957 to 1959	330	33,500	1,500
1954 to 1956	230	21,000	500-1,000
1947 to 1953	68	21,000	500-1,000

[1]Excludes about 2,500 Hispanic households added from the previous November sample. (See "March Supplement.")

[2]The CPS was redesigned following the 1980 Decennial Census of Population and Housing. During phase-in of the new design, housing units from the new and old designs were in the sample.

Estimation Procedure. This survey's estimation procedure inflates weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, sex, race and Hispanic/non-Hispanic categories. The independent estimates were based on statistics from decennial censuses of population; statistics on births, deaths, immigration and emigration and statistics on the size of the Armed Forces. The independent population estimates used for 1981 (1980 for income estimates) to present were based on updates to controls established by the 1980 Decennial Census. Data previous to 1981 were based on independent population estimates from the most recent decennial census. For more details on the change in independent estimates, see the section entitled "Introduction of 1980 Census Population Controls" in an earlier report (Series P-60, No. 133). The estimation procedure for the March supplement included a further adjustment so husband and wife of a household received the same weight.

The estimates in this report for 1985 and later also employ a revised survey weighting procedure for persons of Hispanic origin. In previous years, weighted sample results were inflated to independent estimates

of the noninstitutional population by age, sex, and race. There was no specific control of the survey estimates for the Hispanic population. Since then, the Bureau of the Census developed independent population controls for the Hispanic population by sex and detailed age groups. Revised weighting procedures incorporate these new controls. The independent population estimates include some, but not all, undocumented immigrants.

ACCURACY OF THE ESTIMATES

Since the CPS estimates come from a sample, they may differ from figures from a complete census using the same questionnaires, instructions, and enumerators. A sample survey estimate has two possible types of errors: sampling and nonsampling. The accuracy of an estimate depends on both types of errors, but the full extent of the nonsampling error is unknown. Consequently, one should be particularly careful when interpreting results based on a relatively small number of cases or on small differences between estimates. The standard errors for CPS estimates primarily indicate the magnitude of sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but do not measure systematic biases in the data. (Bias is the average over all possible samples of the differences between the sample estimates and the desired value.)

Nonsampling Variability. Nonsampling errors can be attributed to many sources. These sources include the inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, respondents' inability or unwillingness to provide correct information or to recall information, errors made in data collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

CPS undercoverage results from missed housing units and missed persons within sample households. Compared to the level of the 1980 Decennial Census, overall CPS undercoverage is about 7 percent. CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. As described previously, ratio estimation to independent age-sex-race-Hispanic population controls partially corrects for the bias due to undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from those of interviewed persons in the same age-sex-race Hispanic group. Furthermore, the independent population controls have not been adjusted for undercoverage in the 1980 census.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, "An Error Profile: Employment as Measured by the Current Population Survey," Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, The Current Population Survey: Design and Methodology, Bureau of the Census, U.S. Department of Commerce.

Comparability of Data. Data obtained from the CPS and other sources are not entirely comparable. This results from differences in interviewer training and experience and in differing survey processes. This is an example of nonsampling variability not reflected in the standard errors. Use caution when comparing results from different sources.

Caution should also be used when comparing estimates in this report, which reflect 1980 census-based population controls, with estimates for 1979 (from March 1980 CPS) and earlier years, which reflect 1970 census-based population controls. This change in population controls had relatively little impact on summary measures such as means, medians, and percentage distributions but did have a significant impact on levels. For example, use of 1980 based population controls results in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for data collected in 1981 and later years will differ from those for earlier years by more than what could be attributed to actual changes in the population. These differences could be disproportionately greater for certain subpopulation groups than for the total population.

Since no independent population control totals for persons of Hispanic origin were used before 1985, compare Hispanic estimates over time cautiously.

Note When Using Small Estimates. Summary measures (such as medians and percentage distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, summary measures would probably not reveal useful information when computed on a smaller base. However, estimated numbers are shown even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates permit combinations of the categories to suit data users' needs. Take care in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Sampling Variability. Sampling variability is variation that occurred by chance because a sample was surveyed rather than the entire population. Standard errors,

Table B-1. 1991 Standard Errors of Estimated Numbers: Total or White

Note: For a particular characteristic, see table B-4 for the appropriate factor to apply to the above standard errors.

as calculated by methods described next in "Standard Errors and Their Use," are primarily measures of sampling variability, although they may include some nonsampling error.

Standard Errors and Their Use. A number of approximations are required to derive, at a moderate cost, standard errors applicable to all the estimates in this report. Instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. Thus, the tables show levels of magnitude of standard errors rather than the precise standard errors.

The sample estimate and its standard error enable one to construct a confidence interval, a range that would include the average result of all possible samples with a known probability. For example, if all possible samples were surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

A particular confidence interval may or may not contain the average estimate derived from all possible samples. However, one can say with specified confidence that the interval includes the average estimate calculated from all possible samples.

Some statements in the report may contain estimates followed by a number in parentheses. This number can be added to and subtracted from the estimate to calculate upper and lower bounds of the 90-percent confidence interval. For example, if a statement contains the phrase "grew by 1.7 percent (±1.0)," the 90 percent confidence interval for the estimate, 1.7 percent, is 0.7 percent to 2.7 percent.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis appearing in this report is that the population parameters are different. An example of this would be comparing the educational attainment of Black persons to the educational attainment of White persons.

Tests may be performed at various levels of significance, where a significance level is the probability of concluding that the characteristics are different when, in fact, they are the same. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better. This means that the absolute value of the estimated difference between characteristics is greater than or equal to 1.6 times the standard error of the difference.

Table B-3. **1991 Standard Errors of Estimated Percentages**

Base of percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
Total or White					
75	2.6	4.0	5.5	8.0	9.2
100	2.2	3.5	4.8	6.9	8.0
250	1.4	2.2	3.0	4.4	5.0

1,000	0.7	1.1	1.5	2.2	2.5
2,500	0.4	0.7	1.0	1.4	1.6
5,000	0.3	0.5	0.7	1.0	1.1
10,000	0.2	0.3	0.5	0.7	0.8
25,000	0.14	0.2	0.3	0.4	0.5
50,000	0.10	0.2	0.2	0.3	0.4
100,000	0.07	0.11	0.2	0.2	0.3
Black or Other Races or Hispanic					
25	5.2	8.1	11.1	16.0	18.5
50	3.7	5.7	7.9	11.3	13.1
75	3.0	4.7	6.4	9.3	10.7
100	2.6	4.0	5.6	8.0	9.3
250	1.6	2.6	3.5	5.1	5.9
500	1.2	1.8	2.5	3.6	4.1
1,000	0.8	1.3	1.8	2.5	2.9
2,500	0.5	0.8	1.1	1.6	1.9
5,000	0.4	0.6	0.8	1.1	1.3
10,000	0.3	0.4	0.6	0.8	0.9
20,000	0.2	0.3	0.4	0.6	0.7

Note: For a particular characteristic, see table B-4 for the appropriate factor to apply to the above standard errors.

Standard Errors of Estimated Numbers. There are two ways to compute the approximate standard error, s_x, of an estimated number shown in this report. The first uses the formula

$$s_x = fs \qquad (1)$$

where f is a factor from Table B-4, and s is the standard error of the estimate obtained by interpolation from Table B-1 or B-2. The second method uses formula (2), from which the standard errors in Tables B-1 and B-2 were calculated. This formula will provide more accurate results than formula (1).

$$s_x = \sqrt{-(b/T)x^2 + bx} \qquad (2)$$

Here x is the size of the estimate, T is the total number of persons in a specific age group, and b is the parameter in Table B-4 associated with the particular type of characteristic. If T is not known, for Total or White use 100,000,000; for Black and Hispanic use 10,000,000. When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the factor or set of parameters for the characteristic which will give the largest standard error.

Illustration

Table 1 shows there were 4,817,000 young adults (ages 25 to 29 years) who completed four or more years of college and 20,767,000 total persons in that age group in 1991. Using formula (1) with f = 1.0 from Table B-4, and s = 94,000 from Table B-1, the approximate standard error on 4,817,000 is

$$s_x = 1.0 \times 94{,}000 = 94{,}000$$

The value of s was obtained by linear interpolation in two directions. The first interpolation was between 10,000,000 and 25,000,000 total persons for both 4,000,000 and 5,000,000 estimated number of persons. The value fo r 4,000,000 estimated persons was 88.2 and for 5,000,000 estimated persons was 94.7. The second interpolation was between these two values to get the value corresponding to 4,817,000 persons.

Using the second method with b = 2,532 from Table B-4, the approximate standard error is

$$s_x = \sqrt{-\frac{2{,}532}{20{,}767{,}000} \times 4{,}817{,}000^2 + 2{,}532 \times 4{,}817{,}000} = 97{,}000$$

This means that a 90-percent confidence interval for this estimate is from 4,662,000 to 4,972,000, i.e, 4,817,000 ± 1.6x97,000. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard Errors of Estimated Percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameter from Table B-4 indicated by the numerator.

The approximate standard error, $s_{x,p}$, of an estimated percentage can be obtained by use of the formula

$$s_{x,p} = fs \qquad (3)$$

In this formula, f is the appropriate factor from Table B-4, and s is the standard error of the estimate obtained by interpolation from Table B-3.

Alternatively, formula (4) will provide more accurate results. The standard errors in Table B-3 were calculated with this formula.

$$s_{x,p} = \sqrt{\frac{b}{x} p(100 - p)} \qquad (4)$$

Here x is the total number of persons, families, households, or unrelated individuals in the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in Table B-4 associated with the characteristic in the numerator of the percentage.

Illustration

As shown in Table 1, of the 2,730,000 Black persons aged 25 to 29, 2,229,000 or 81.6 percent were high school graduates in 1991. Using formula (3) with f 1.0, and s 1.4 from Table B-3, the approximate standard error is

$$s_{x,p} = 1.0 \times 1.4 = 1.4$$

Using the alternate method with b = 3,425 from Table B-4, the approximate standard error on an estimate of 81.6 percent is

$$s_{x,p} = \sqrt{\frac{3{,}425}{2{,}730{,}000} \times 81.6 \times (100.0 - 81.6)} = 1.4$$

This means that a 90-percent confidence interval or the estimated percentage of Black persons in 1989 who graduated from high school is from 79.4 to 83.8 percent, i.e., 81.6 ± 1.6x1.4.

Standard Error of a Difference. The standard error of the difference between two sample estimates is approximately equal to

$$s_{x-y} = \sqrt{s_x^2 + s_y^2} \qquad (5)$$

where s_x and s_y are the standard errors of the estimates, x and y. The estimates can be numbers, percentages, ratios, etc. This will result in accurate estimates of the standard error of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same

TABLE B-4. **1991 Standard Error Parameters and Factors for Educational Attainment**

Characteristics	Total or White		Black or Other Races		Hispanic	
	b	f	b	f	b	f

Income, Earnings	2,485	0.9	2,485	0.9	2,485	0.6
Employment Status, Occupation:						
Both Sexes	2,485	1.0	2,485	0.9	2,485	0.4
Male	2,150	0.9	2,150	0.6	2,150	0.4
Female	1,843	0.9	1,843	0.7	1,843	0.6

Notes: To estimate standard errors for school enrollment prior to 1991 multiply the b parameter for 1991 by the appropriate factor in table B-5. The b parameters should be multiplied by 1.5 for nonmetropolitan residence categories. The b parameters should be multiplied by 1.91 for farm characteristics. The b parameters should be multiplied by the factors in table B-6 or B-7 for regional and state data.

Table B-5. **Factors to Calculate Educational Attainment b Parameters Prior to 1991**

Year	Total or White	Black or Other Races	Hispanic
1990	1.00	1.00	1.00
1988-1989	1.08	1.08	1.30
1985-1987	0.91	0.91	0.93
1982-1984	0.91	0.91	0.77
1977-1981	0.82	0.82	0.68
1967-1976	0.80	0.80	0.67
1957-1966	1.22	1.22	(X)
before 1956	1.83	1.83	(X)

(X) Not applicable

Note: Apply the appropriate factor to the b parameter for 1991.

area. However, if there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration

Table 1 shows that in 1991 an estimated 86.6 percent of the 8,568,000 White women 25 to 29 years old graduated from high school as compared to 80.1 percent of the 1,460,000 Black women 25 to 29 years old. The apparent difference is 6.5 percent. Using formula (4) and b = 2,532 from table B-4, the standard error on the estimated percentage of White female high school graduates, 25 to 29, is 0.6. Using formula (4) and b = 3,425 from Table B-4, the standard error on the estimated percentage of Black female high school graduates, 25 to 29, is 1.9.

Therefore using formula (5) the standard error of the estimated difference of 6.5 percent is about

$$s_{x-y} = \sqrt{0.6^2 + 1.9^2} = 2.0$$

This means that the 90-percent confidence interval around the difference is from 3.3 to 9.7 percent, i.e.,6.5 ± 1.6x2.0. Therefore a conclusion that the average estimate of the difference derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples. Since the interval does not contain zero, we can conclude with 90-percent confidence that White females ages 25 to 29 have a greater percentage of high school graduates than Black females of the same age group.

Standard Error of a Median. The sampling variability of an estimated median depends on the form of the distribution and the size of the base. One can approximate the reliability of an estimated median by determining a confidence interval about it. (See the section "Standard Errors and Their Use" for a general discussion of confidence intervals.)

Estimate the 68-percent confidence limits of a median based on sample data using the following procedure.

1. Determine, using formula (4), the standard error of the estimate of 50 percent from the distribution.
2. Add to and subtract from 50 percent the standard error determined in step 1.
3. Using the distribution of the characteristic, determine upper and lower limits of the 68-percent confidence interval by calculating values corresponding to the two points established in step 2.

$$X_{pN} = \frac{pN - N_1}{N_2 - N_1}(A_2 - A_1) + A_1 \qquad (6)$$

where

X_{pN} = estimated upper and lower bounds for the confidence interval ($0 \leq p \leq 1$). For purposes of calculating the confidence interval, p takes on the values determined in step 2. Note that X_{pN} estimates the median when $p = 0.50$.

N = *for distribution of numbers:* the total number of units (persons, households, etc.) for the characteristic in the distribution.

N = *for distribution of percentages:* the value 1.0.

p = the values obtained in step 2.

A_1, A_2 = the lower and upper bounds, respectively, of the interval containing X_{pN}.

N_1, N_2 = *for distribution of numbers:* the estimated number of units (persons, households, etc.) with values of the characteristic greater than or equal to A_1 and A_2, respectively.

N_1, N_2 = *for distribution of percentages:* the estimated percentage of units (persons, households, etc.) having values of the characteristic greater than or equal to A_1 and A_2, respectively.

4. Divide the difference between the two points determined in step 3 by two to obtain the standard error of the median.

   Use of the above procedure could result in standard errors which differ from those given in the detailed tables. The reasons for this discrepancy are the use of a more detailed distribution than that given in the tables in determining the published standard errors, and the rounding of the numbers to thousands in the published tables. Linear interpolation was almost always used to compute the published medians and standard errors. Occasionally, a median may lie in an open-ended interval. To calculate its standard error, the user must call Population Division of the Census Bureau to obtain the methodology.

Illustration

Table 1 shows that in 1991 the median years of school completed by Black persons 25 years old and over was 12.4. Table 1 also shows that the base of the distribution from which this median was determined was 17,096,000 persons.

5. Using formula (4) and b = 3,425 from Table B-4, the standard error of 50 percent on a base of 17,096,000 is about 0.7 percentage points.

6. Adding to and subtracting from 50 percent the standard error found in step 1 to obtain a 68-percent confidence interval on the estimated median yields limits of 49.3 percent and 50.7 percent.

7. From Table 1, in 1991 33.3 percent of Black persons aged 25 years old and over completed less than 12 years of school and 71.0 had completed less than 13 years of school. Using formula (6), the lower limit for the confidence interval of the median is found to be about

$$\frac{0.493 \times 1.0 - 0.333}{0.710 - 0.333}(13.0 - 12.0) + 12.0 = 12.42$$

Similarly, the upper limit is approximately

$$\frac{0.507 \times 1.0 - 0.333}{0.710 - 0.333}(13.0 - 12.0) + 12.0 = 12.46$$

Thus, a 68-percent confidence interval for the median school years completed by Black persons 25 years old and over is from 12.42 to 12.46. 4.

8. Finally, the standard error of the median is

$$(12.46 - 12.42)/2 = 0.02$$
